SUMMARY

Agentic AI engineer working in FinTech domain for the past 8 months. Passionate about Stock Markets, options and other financial instruments and building meaningful AI agents, I believe that AI powered financial products are just starting out, and can have huge implications in the financial world.

TECHNICAL SKILLS

- **Languages:** Python
- **AI & ML Frameworks:** LangGraph, Hugging Face, FAISS, Sentence-Transformers, Langchain
- **Web & Backend:** React.js, Next.js, FastAPI
- **DevOps:** Docker, Git, GitHub, Rancher
- **AI Tools:** Claude Code (using claude code daily for the past 8 months as a part of my work, can effectively use claude with multiple worktrees on git and build 10x faster, but responsibly using proper project context managed by skills, claude.md and other form of documentation as required by the project)

WORK EXPERIENCE

Winbold — *AI/Backend Engineer*

Dec 2025 – Present

Tech Stack: Python, LangGraph, FastAPI, PostgreSQL, React/TypeScript, Kubernetes (k3s), LiteLLM, Docker

- Built and operate an AI-powered trading strategy platform that turns market events into executable, risk-gated trading campaigns.
- Designed and shipped a multi-agent LLM system on LangGraph (ported from Agno): a leader agent orchestrating parallel ReAct worker agents across a 9-model strategy matrix, with deterministic fan-out, forced tool-capture nodes, and strict per-stage timeout budgets.
- Defined and enforced a versioned JSON contract with a downstream trade-execution engine, pinned by schema-mirroring contract tests, and built the orchestration layer for live trading sessions with multiple independent safety gates.
- Owned the full stack end to end: FastAPI services, PostgreSQL persistence with migrations, and a React/TypeScript dashboard (SSE streaming, React Flow DAGs, candlestick charting).
- Migrated deployment from Docker Compose to Kubernetes (k3s) with GitHub Actions CI/CD, exposing services through outbound-only Cloudflare Zero Trust tunnels with SSO — no inbound ports on a shared host.
- Cut and controlled LLM spend via a LiteLLM proxy: per-tier model routing, prompt-cache-aware session affinity, per-key budget alerts, and per-request cost attribution; eliminated an unbounded-retry cost leak and codified it as an engineering invariant.
- Hardened production reliability: event-loop-safe async I/O, persistence decoupled from client connections, and observability with Opik tracing and a versioned prompt registry; diagnosed and resolved outages including a host-compromise incident response.

CodeCraft Ventures — *Co-Founder*

Jan 2024 – Mar 2025

Tech Stack: Python, Machine Learning, Web Development (varied per client project)

- Co-founded a client-facing software services startup with two partners, building out machine learning and web development products tailored to each client's requirements.
- Handled client communication, requirement gathering, and delivery deadlines directly, developing strong communication skills and the ability to work under pressure.
- Experimented with a wide range of tech stacks across web, backend, and ML projects during this early stage of my coding journey — an exploration that led me to discover my real passion: AI agents and their applications in the real world.

EDUCATION

B.Tech in Computer Science

2019 – 2023

APJ Abdul Kalam Technological University

CGPA: 7.1

CERTIFICATIONS

- **Machine Learning Crash Course**, Google
