SUMMARY

AI engineer building agent systems in FinTech. I follow stock markets, options, and other instruments closely, and I build agents that act on them. AI-driven financial products are still early, and I think they will matter far more than they currently do. My strongest strength is the ability to iterate quickly

TECHNICAL SKILLS

- **Languages:** Python
- **AI & ML Frameworks:** LangGraph, LangChain, Hugging Face, FAISS, Sentence-Transformers
- **Web & Backend:** React.js, Next.js, FastAPI
- **DevOps:** Docker, Git, GitHub, Rancher
- **AI Tools:** Claude Code, used daily for 8 months. I run it across several git worktrees in parallel, with project context kept in CLAUDE.md, skills, and whatever else the project needs documented.

WORK EXPERIENCE

Winbold — AI/Backend Engineer

Jan 2026 – Present

Tech Stack: Python, LangGraph, FastAPI, PostgreSQL, React/TypeScript, Kubernetes (k3s), LiteLLM, Docker

- Built and run an AI trading strategy platform that turns market events into trading campaigns, each one gated on risk checks before it can execute.
- Ported the multi-agent LLM system from Agno to LangGraph. A leader agent fans out to parallel ReAct workers across a 9-model strategy matrix; the fan-out is deterministic, tool capture is forced at its own node, and every stage runs under a timeout budget.
- Defined the versioned JSON contract the downstream trade execution engine runs on, with contract tests mirroring the schema so drift is caught before it reaches a live session. Live sessions run through an orchestration layer I built, behind several independent safety gates.
- The stack is mine end to end, from FastAPI services and PostgreSQL migrations up to the React/TypeScript dashboard, which streams over SSE and renders DAGs in React Flow alongside candlestick charts.
- Moved deployment off Docker Compose onto Kubernetes (k3s) with GitHub Actions CI/CD. Services are exposed through outbound-only Cloudflare Zero Trust tunnels with SSO, so the shared host has no inbound ports open.
- Put a LiteLLM proxy in front of everything to get spend under control: models routed by tier, sessions kept sticky so prompt caches actually hit, budget alerts per key, cost attributed per request. An unbounded retry loop was leaking money until I caught it, and bounded retries are now a rule in the codebase.
- Kept production stable with event-loop-safe async I/O, persistence decoupled from client connections so a disconnect cannot lose the work, Opik tracing, and a versioned prompt registry. Also ran incident response on outages, including a host compromise.

CodeCraft Ventures — Co-Founder

Jan 2024 – Mar 2025

Tech Stack: Python, Machine Learning, Web Development (varied per client project)

- Co-founded a software services startup with two partners, building machine learning and web products to each client's spec.
- Handled client communication, requirement gathering, and delivery deadlines directly.
- Worked across a wide range of stacks on web, backend, and ML projects. That range is how I landed on AI agents and their applications, which is what I have worked on since.

EDUCATION

B.Tech in Computer Science

2019 – 2023

APJ Abdul Kalam Technological University

CGPA: 7.1

CERTIFICATIONS

- Machine Learning Crash Course, Google
